

Kuhn GF 10012

Description

GF 13012 and GF 17003 models with their 12 and 16 rotors respectively produce high work output. You can reach speeds of up to 15 ha/h with the GF 17003 model. Both models guarantee high output, optimum tedding quality and excellent ground following with the GSC (Ground Save Control) system. Ground scraping is reduced by 50% which means that the tilled crop is less contaminated by impurities and drying time is shorter, resulting in nutrient preservation in the forage. All of the crop on the plot dries out uniformly so you can harvest it at the ideal time to get high quality forage!
