

Kuhn VKM

Description

The 4 models of the VKM series of shredders allow optimal management of fallow land, pastures and of grass regrowth with a working width comprised between 2.09 and 3.03 m. The management of pastures and fallow land is an important part of the production system. Shredding is essential to maintain or improve pasture quality. Cattle pick out the best grass to feed on, leaving less attractive species on the pasture. If this low quality grass is not shredded, it will spread through seeds or vegetative propagation. This reduces pasture quality on the whole and consequently also animal productivity.. In addition to allowing you to manage pastures and fallow land, VKM shredders are also suitable for shredding branches.
